MINERAL PRODUCTION IN ILLINOIS IN 1960

W. L. Busch

ABSTRACT

The value of minerals produced in Illinois in 1960 totaled almost 616 million dollars. Revised figures for 1959 totaled 606.3 million dollars. The minerals include coal, oil and associated products, stone, sands and gravel, fluorspar, metals, and such related items as clay products, cement, and lime. The amount and value of minerals produced in Illinois during 1960 and 1959 are summarized in tables, maps, and charts in this report.

INTRODUCTION

Illinois is a wealthy state—wealthy in agriculture, commerce, manufacturing, and the production of mineral materials. The wealth of the state is due to its central location, which fosters commerce and the economical assembling of materials for manufacturing, and to its fertile soil and great stores of mineral resources, including coal, oil and gas, fluorspar, zinc and lead, stone, clays, silica sand, and such homely products as common sand and gravel.

The material well-being and industrial stability of Illinois is founded in the remote past when vast beds of coal were formed; extensive layers of limestone, dolomite, clay and shale, and sandstone were laid down; deposits of fluorspar, zinc, and lead filled cracks and crevices; and oil and gas accumulated in porous rocks. The great ice sheets that covered most of Illinois thousands of years ago left behind a blanket of unconsolidated rock material from which developed the state's rich soils. Glacial debris also filled preglacial stream valleys with sand and gravel that now holds abundant resources of ground water. New watersheds and stream patterns were formed, and some of the new stream valleys became our present lines of travel and transport. The Great Lakes, as finally formed, and broad navigable rivers put Illinois into ready communication with Canada, the Atlantic, and the Gulf of Mexico.

Today, Illinois is essentially a prairie and it presents few physiographic contrasts. The mean elevation is about 600 feet above sea level, and the total relief of the state is 973 feet. The highest point, Charles Mound in the northwest corner of the state, is 1,241 feet above sea level, and the lowest point, the junction of the Ohio and Mississippi Rivers, is 268 feet above sea level.

The fact that Illinois, long known as the Prairie State, has been well endowed with useful rocks and mineral materials often is overlooked. Illinois ranks eighth among states of the nation in the production of mineral products and has produced more than 600 million dollars worth of such materials annually since 1956.

TABLE 1 - SUMMARY OF ILLINOIS MINERAL PRODUCTION, 1959-1960^a

Material	Unit	1959*,b			1960 ^b		
		Value at plants		Quantity	Value at plants		Av.
		Total	Av.		Total	Av.	
Coal - bituminous	tons	45,374,626	\$ 4.06	45,820,632	\$183,740,734	\$ 4.01

c Includes natural gas, natural gasoline, liquefied petroleum gases, and lime.

That mineral industries of Illinois have responded well to the needs of a growing population and a growing economy during the last three decades is illustrated by the fact that in 1930 the mineral product of Illinois amounted to less than 150 million dollars. The state's ever increasing demand for energy and power, improved streets and highways, additional housing, stores and other commercial buildings, schools, recreational facilities, churches, hospitals, and other community structures has been substantially met by Illinois fuels, building materials, and other mineral products.

SUMMARY OF 1960 MINERAL PRODUCTION

During 1960 Illinois produced a total of 615.8 million dollars worth of mineral products—a new all-time record (table 1). The previous Illinois record had been established in 1956 when mineral products reached the 613.4 million-dollar mark (table 2). The new record exceeds the 1959 total by 9.5 million dollars, with some minerals accounting for the increase and others remaining at or near 1959 levels.

The value of fuels produced in Illinois in 1960 was about 68 percent of the total value of all minerals (fig. 1). However, the production of these fuels—coal, crude oil, and associated products—remained very close to 1959 levels.

The second largest group of Illinois minerals in terms of total value are stone products, which include crushed stone, cement, and lime. As a group these commodities contributed 15 percent of the 1960 total value (fig. 2). The tonnage and value of crushed stone reported produced during 1960 showed significant increases over the amounts reported for 1959.

Although production of clay products in Illinois declined slightly during 1960, the 56.6 million dollars contributed by this industry was 9 percent of the state's

total value of all mineral products. Table 3 gives the percentage of total mineral value contributed by the clay and other mineral industries from 1940 through 1959. Clay products include face brick and common brick, structural tile, drain and sewer tile, refractories, pottery and whiteware.

In 1960 sand and gravel production increased slightly over 1959 levels and furnished 5.5 percent of the Illinois total mineral products value. This group of minerals includes common sand and gravel, silica sand, and natural bonded molding sand.

Fluorspar, zinc, and lead, the other minerals produced in Illinois, showed a gain in production for the year. As a group these three minerals had a value of over 15 million dollars in 1960, 2.5 percent of the state's total value. Table 4 indicates the average price per ton for these and other minerals produced in Illinois from 1940 through 1959.

Fig. 1 - Value of Illinois mineral production in 1960 was 615.8 million dollars. Percentage contributions by the various segments of the Illinois mineral industry are shown above.

Fig. 2 - Value of Illinois mineral production compared for 1952 to 1960.

COAL INDUSTRY

About 300 years ago the first recorded discovery of coal in the United States was made in Illinois near the present city of Ottawa. Since that time some 3.6 billion tons of coal are known to have been extracted from Illinois mines. However, the calculated reserves of bituminous coal in Illinois, amounting to over 136 billion tons, exceed those of any other state.

For many years Illinois has ranked as the fourth largest coal producing state in the nation (table 5), outranked in annual tonnage by only West Virginia, Kentucky, and Pennsylvania (fig. 3). During 1960 Illinois produced almost 46 million tons of coal, more than 11 percent of all coal produced in the United States.

The value of coal produced in Illinois during 1960 amounted to a little less than 184 million dollars. Although slightly more coal was produced in 1960 than

TABLE 5 - NATIONAL PRODUCTION OF BITUMINOUS COAL, 1957-1960^a
(thousands of tons)

State	1957	1958	1959*	1960	Percent of 1960 total
West Virginia	156,842	119,468	119,692	118,944	28.6
Pennsylvania	85,365	67,771	65,347	65,425	15.8
Kentucky	74,667	66,312	62,810	66,847	16.1
Illinois	46,993	43,912	45,466	45,977	11.1

* Revised figures.

a Source: U. S. Bureau of Mines.

in 1959, the total value was somewhat less because of a slight drop in the average value per ton. Nevertheless, coal contributed 30 percent to the state's total value of all mineral products, and because of substantial reserves and nearby markets a long future is assured for the Illinois coal industry.

Production

The record of Illinois coal production for 1960 is shown in tables 6 and 7. Table 6 summarizes the 1960 production in terms of tons of coal produced, type of mine (strip or underground), number of mines, and the approximate value of the product for each producing county. Of the 38 counties producing coal, 13 produced more than one million tons each for a combined total of 90 percent of the state's 1960 output. Strip mining was important in more than half of the producing counties in 1960 and accounted for almost 50 percent of the total tonnage.

The production of coal by counties since 1882, when mining records were begun, is shown in table 7. Of the 70 counties that have produced coal during this 79-year period, 11 have accounted for three-fourths of the state's entire output, each producing more than 100 million tons of coal. Table 7 also records

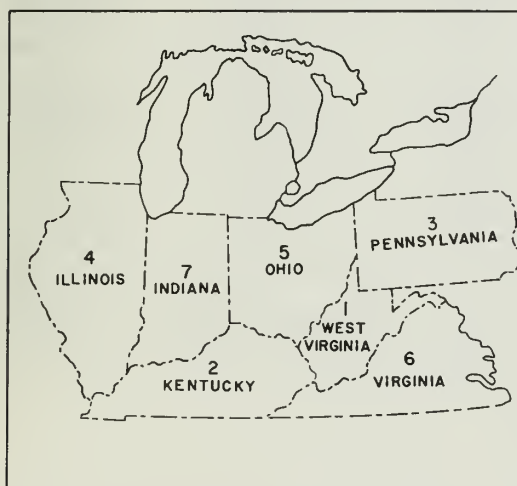

Fig. 3 - States that produced 90 percent of the nation's bituminous coal in 1960.

a Source: Illinois State Department of Mines and Minerals.

the total number of years that each county has produced coal since 1882 and the last year it produced coal.

Illinois has 10 of the 50 largest bituminous coal mines in the United States, ranked by 1960 tonnage produced. One of the 10 was the second largest producer in the nation and had produced over four million tons of coal. The other nine mines ranked number 4, 10, 15, 17, 34, 42, 43, 49, and 50. Together the ten mines produced 20.1 million tons of coal, 21 percent of the total coal produced by the 50 largest mines in the United States, and about 44 percent of the total coal produced in Illinois during 1960. The Illinois mine that ranked last in the list of 50 mines produced more than 1.3 million tons of coal.

The 38 counties in Illinois that produced coal in 1960 are shown in figure 4, with the intensity of mining activity illustrated by the degree of shading. The map (fig. 4) also indicates how close the large metropolitan and manufacturing centers of the state are to unlimited supplies of coal. Chicago, the largest urban and

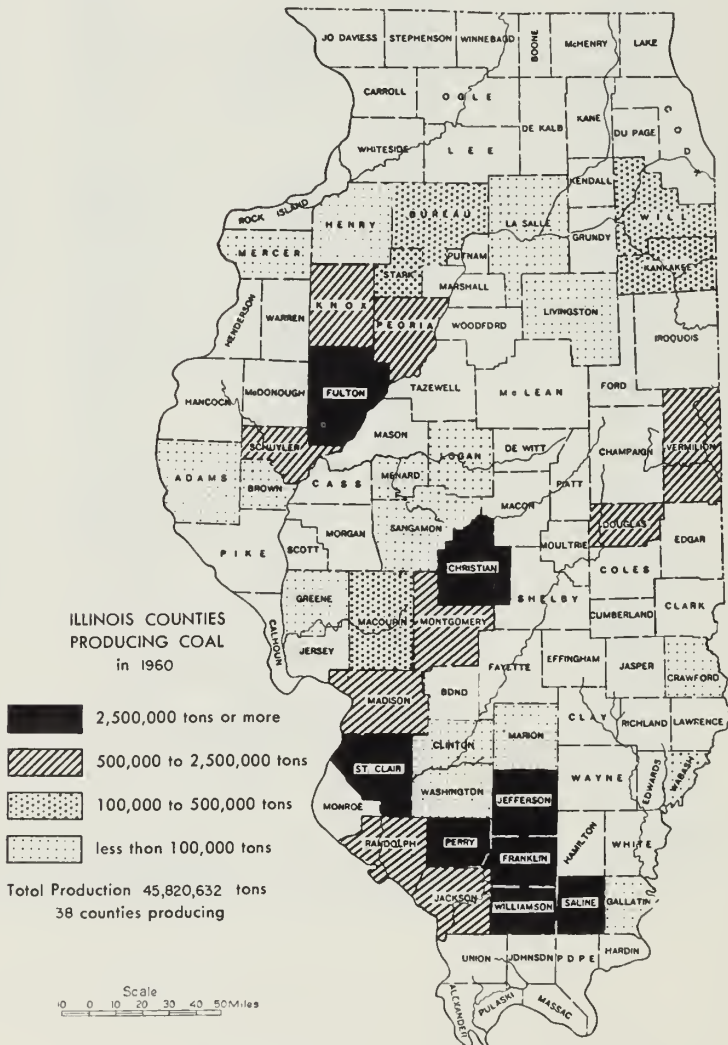

Fig. 4 - Illinois coal production by counties in 1960.

manufacturing center in the state, is on a direct railroad line from the southern Illinois coal fields. Other important manufacturing cities of the state all have ample supplies of coal nearby or readily available by rail or water shipment from Illinois coal fields.

PETROLEUM INDUSTRY

Oil production in the United States during 1960 totaled more than 2.5 billion barrels, the tenth consecutive year in which more than 2 billion barrels of crude oil were produced. Ten states, eight of them lying west of the Mississippi River, accounted for over 91 percent of the 1960 domestic production (table 8). Texas held the dominant position with about 36 percent of the nation's output. Louisiana, California, and Oklahoma, the three next largest producers, contributed a combined total of about 35 percent of the nation's production. The other six main oil producing states—Wyoming, Kansas, New Mexico, Illinois, Mississippi, and Colorado—are comparatively small producers, although the production of some of them (table 8) has been increasing in recent years.

b Preliminary figures.

The oil and gas reserves of each state are estimated by the industry every year. Only the reserves that have been proved and can be recovered under existing economic and operating conditions (table 9) are included in the estimates. The figures do not imply that all the oil or gas in a state or in the nation has been discovered, but they do represent a known amount of oil or gas (table 10) on a given

date. The nation's oil reserves, estimated at the beginning of 1961, had declined slightly from the high reserves estimated at the start of 1960. Although the decline was small, amounting to some 106 million barrels, the reserve figures will be worth noting each year in the light of this country's continued and growing demand for liquid fuels.

Illinois Oil Production

Illinois oil production for 1960 was estimated to be 77,341,000 barrels, a slight increase over the 76,727,000 barrels produced in 1959 (fig. 5). Peak production for Illinois oil was attained in 1940 when 147,647,000 barrels was produced, after which production gradually declined to a low of just over 59 million barrels in 1953. In 1954, through a combination of increased drilling and oil well treatment techniques, such as fracturing and waterflooding, the downward trend was reversed and production increased to the 1956 postwar high of 82.3 million barrels. Although drilling has declined in recent years, production has remained fairly level because secondary methods of oil recovery in Illinois have been contributing increasing amounts of the total oil produced. In 1960 about two-thirds of Illinois oil was produced by such processes. The average value for Illinois oil in 1960 was estimated at \$2.98 per barrel for a total of about 230.3 million dollars.

Fig. 5 - Illinois production of crude oil, 1905-1960.

For many years the value of coal mined in Illinois exceeded that of any other mineral produced within the state; however, since 1954 the value of crude oil has been the largest single segment of the state's total annual mineral value. For 1960, Illinois crude oil, together with its associated products of gas and liquefied petroleum gases, accounted for about 38 percent of the state total.

The first major oil boom in Illinois occurred from 1905 to about 1912. Peak production was reached in 1908 when some 33.6 million barrels of oil was produced.

In 1935 an intensive search for new oil fields began in downstate Illinois. After months of scientific exploration the first test wells were drilled early in 1937, and their successful completion sparked a drilling campaign that discovered many new pools in the south-central part of the state. The second major period of oil production was from 1937 to 1941, the production for 1940 being the all-time high. Table 11 summarizes well completions and production since 1936.

TABLE 11 - ILLINOIS WELL COMPLETIONS AND PRODUCTION, 1936-1960

Year	Completions ^a	Producing wells		Production ^{b,c} (thousands of barrels)

a Includes only oil and gas producers and dry holes.

b Based on information furnished by oil and pipeline companies.

c From U. S. Bureau of Mines through 1950.

Table 12 gives, by county, the estimated amount and value of oil produced in Illinois in 1960 and each county's percentage of the state total. The map in figure 6 shows the 42 counties in Illinois that produced oil in 1960 and indicates the major oil producing counties. For several years after the new oil fields were discovered in southern Illinois, 25 to 35 new pools were found annually. In recent years the number of new pools has been declining; in 1960 only 10 new oil pools and 1 gas pool were found. As productive areas are drilled up, discovery wells are more likely to be extensions of pools than discovery wells of new pools. The map (fig. 7) which outlines most of southern Illinois and indicates the extent of the Illinois oil basin, shows the relative sizes of the various oil fields together with the new fields discovered in 1960.

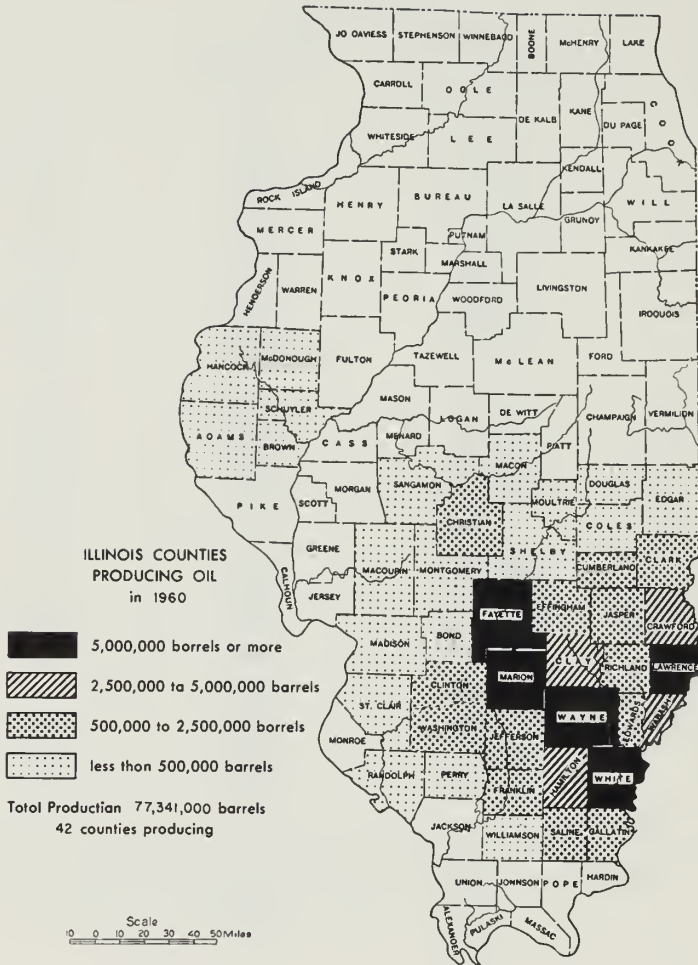

Fig. 6 - Illinois oil production by counties in 1960.

STONE, SAND, AND GRAVEL

During 1960, 37 million tons of crushed and broken stone was produced in Illinois and was valued at almost 51 million dollars. The tonnage reported for 1960 is a 16 percent increase over the 31.9 million tons reported for 1959. The average value of stone produced in 1960 was \$1.38 per ton, compared to the 1959 average value of \$1.31. The total value of stone reported for 1959 was 41.7 million dollars.

Illinois counties leading in the production of crushed stone for various purposes are Cook, Will, St. Clair, Kankakee, DuPage, Randolph, Livingston, Vermilion, and Johnson. As a group, these nine counties produced over 25 million tons of stone in 1960, valued at more than 34.5 million dollars. In 1960 these

counties, which make up 16 percent of the 56 counties reporting stone production, quarried about 68 percent of the total tonnage produced. Cook County, the leading stone producing county in the state, produced more than 12.8 million tons, valued at 18.3 million dollars. Union, Rock Island, Carroll, Peoria, Adams, Winnebago, and Madison Counties also produced important quantities of stone in 1960. Together they produced a total of almost 4.9 million tons of crushed stone valued at over 6.8 million dollars. Production figures indicate that the 16 counties in the two groups above produced over 30 million tons of stone, or 81 percent of the 1960

Fig. 8 - County outline map of Illinois showing area division.

state total, while the remaining 40 counties reporting stone production accounted for the other 19 percent.

Crushed limestone and dolomite production in Illinois is summarized in table 13, which shows revised figures for 1959 and final figures for 1960. Reports from producers were unusually complete concerning their 1960 production, enabling a detailed accounting (table 14) of stone production in Illinois according to region (fig. 8) and according to three major categories of use—stone for road and building, agriculture, and all other uses. Table 14 also lists every county reported to have had stone production, as well as the average value at the quarry for all categories of stone in all regions.

The various types of construction that require the use of crushed stone include highway and road building and maintenance, both paved and unpaved surfaces; urban and rural residential construction, including alterations to existing units as well as new units; nonresidential buildings for industry, including factories, office buildings, warehouses, stores, garages, restaurants, and complexes like shopping centers; community buildings such as schools, churches, hospitals and institutions, and recreational structures; public utility construction, including railroad facilities, telephone installations, and electric light and power projects; public construction such as military installations, administrative and service buildings, housing projects, sewer and water systems, and many other developments. In addition to its use in these various kinds of construction, crushed stone has a great many other uses, one of which is agricultural.

Agricultural limestone (agstone) is an important source of calcium for farm soils and, therefore, is an important quarry product. Table 14 gives the 1960 figures on the production of agstone. According to a nation-wide survey conducted by the National Lime Association, in 1960 Illinois led all states in the use of agstone spread on farm lands with a total of 3.1 million tons. The state of Missouri was second with a total of 2.6 million tons used, Ohio was in third place with approximately 2.1 million tons, and Indiana was fourth with 1.7 million tons. Most other states reporting the use of agstone used considerably smaller quantities. Soils supporting increased crop yields that result from the use of commercial fertilizers ultimately will require applications of agricultural limestone to replenish the calcium removed.

Sand and Gravel

Common sand and gravel, deposited by the glaciers, are found in many places in Illinois. They are used extensively in the construction industry, in building and maintaining highway and railway roadbeds, and for other uses similar to those outlined above for stone. Revised production figures for common sand in 1959 and final figures for 1960 are summarized in table 15. Table 16 gives a detailed review of common sand production in Illinois according to region (fig. 8) and according to use. Tables 17 and 18 and figure 8 give the same information for gravel. Illinois is fortunate in possessing substantial deposits of sand and gravel reasonably accessible to the principal market areas.

Special Sands

Special sands in Illinois include two sands that have special and important uses in industry. One of these is a natural bonded molding sand that is produced in small quantities each year. In 1960 only 38,900 tons was produced, valued at

a Grinding and polishing, blast, fire and furnace, engine, filter.

b For abrasives, ceramics, foundry, and filler from ground siliceous material.

The other special sand of Illinois is silica sand. This mineral, which is produced in substantial quantities in LaSalle County and in lesser amounts in Ogle County, is a nearly pure quartz (a natural form of silica) sand. During 1960 about 2.5 million tons of silica sand was produced for various uses and was valued at more than 9.7 million dollars (table 19). According to 1960 production figures, the largest individual use for Illinois silica sand was in the manufacture of glass. The usual types of glass are made by melting a mixture of chemicals containing about two-thirds silica sand. The second most important use for the state's silica sand was for molding sand purposes. Silica sand, when tempered by the addition of clay or other binding material, makes an excellent molding sand because it can withstand the great heat of metal casting.

CLAY PRODUCTS

The manufacture of Illinois clay products reported for 1960 amounted to more than 56.6 million dollars. Although this amount was 1.7 million dollars below the 58.3 million dollar value reported in 1959, it represents a very productive year for the industry. Clay products include such items as face brick and common brick, sewer pipe and drain tile, flue pipe, building tile, vitreous plumbing fixtures, glazed tile, electrical porcelains, and pottery and whiteware. Also included in the list of Illinois clay products are the various forms of special heat-resistant

fire brick and silica brick used by the metallurgical industries. Table 20 summarizes the production of clay products for the years 1959 and 1960. Table 21 lists, by county, the number of clay products plants in Illinois reporting production for 1960. The county outline map of Illinois (fig. 8) shows the nine sections of the state used in tabulating this list of plants.

CEMENT

The manufacture of cement is the fifth largest mineral industry in value of product in Illinois. Two counties possess the state's present four cement manufacturing plants; two are located at Oglesby and one at LaSalle in LaSalle County, and one at Dixon in Lee County. Figures in table 1 show that Illinois shipped a total of more than 9.1 million barrels of all types of cement in 1960, valued at more than 30.7 million dollars.

Because the industry is highly competitive, the success of a plant depends upon the market outlet obtainable for its product when the plant is operating at or near capacity. Because transportation is an important element in the delivered cost of cement, the continued successful operation of a plant depends upon a large market potential in its vicinity and upon available low-cost transportation facilities. The Illinois cement industry, located in the north-central part of the state, is near a substantial market area and has available to it both rail and water transportation systems.

FLUORSPAR

Final figures for 1960 indicate that Illinois produced and shipped 134,529 tons of finished fluorspar, which was 58.5 percent of the 229,782 tons of finished fluorspar produced and shipped in the United States. During 1960, fluorspar imported for consumption in the United States amounted to 534,020 tons, and the total consumed amounted to 643,759 tons. Illinois supplied about 21 percent of all fluorspar (domestic and foreign) consumed in the United States.

Fluorspar is an important raw material for the iron and steel, aluminum, chemical, glass, and ceramics industries. Commercial fluorspar is graded principally according to its content of calcium fluoride and is prepared ordinarily as metallurgical grade, acid grade, and ceramic grade.

The mineral fluorite, commonly called fluorspar, is glassy in appearance, fairly heavy, and brittle. It is transparent or translucent and commonly ranges in color from green to white, but also occurs in other hues. Crystallization usually takes the form of cubes.

In recent years the increased use of acid grade fluorspar by the aluminum and chemical industries for the manufacture of hydrofluoric acid has put this use of fluorspar in first place. According to a report by the U. S. Bureau of Mines, 372,654 tons of fluorspar was used in the manufacture of hydrofluoric acid during 1960. Hydrofluoric acid is used in the manufacture of aluminum fluoride and synthetic cryolite, both needed in the manufacture of aluminum. In the chemical industry, hydrofluoric acid is used primarily as an intermediate in the manufacture of fluorine compounds. In 1960 a total of 379,576 tons of acid grade fluorspar was consumed in the United States.

a Refer to figure 8.

The steel industry, formerly the dominant consumer of fluorspar, uses it as a flux in the production of basic open-hearth steel, electric furnace steel, ferro-alloys and alloy steel, and Bessemer steel; iron foundries also use it. The U. S. Bureau of Mines reports that a total of 229,929 tons of metallurgical grade fluorspar was consumed in the United States in 1960.

Ceramic grade fluorspar is used principally in the manufacture of opal, opaque, and colored glass, and to make colored enamels for coating metal and metalware and ceramic tile. A total of 34,254 tons of ceramic grade fluorspar was consumed in 1960, according to the U. S. Bureau of Mines.

b Montana fluorspar value included with other states.

Table 22, which indicates the amount of fluorspar shipped from mines in the United States in 1960, shows that Illinois was the foremost producer of this mineral in the country. Table 23, which lists the more important fluorspar consuming areas of the country, shows that Illinois is also a large consumer of fluorspar.

METALS

Final figures for 1960 indicate that mine output of zinc in Illinois amounted to 29,550 tons and was valued at more than 7.6 million dollars. Illinois lead production totaled 3,000 tons, with a value of \$702,000 for 1960. No silver was reported for 1960, the fourth consecutive year that this metal has not been produced from Illinois mining operations (table 24).

Zinc and lead are produced in Illinois from primary metal mines in Jo Daviess County located in the northwestern part of the state, and as by-products of fluor-spar mining in Hardin and Pope Counties in southern Illinois. Northern Illinois mines produced 20,325 tons of zinc and 1,245 tons of lead during 1960, while southern Illinois mines recovered 9,225 tons of zinc and 1,755 tons of lead.

SUMMARY OF MINERALS PRODUCED BY ILLINOIS COUNTIES, 1960

Table 25 of this report was designed as a quick and convenient reference to the counties in Illinois producing any of the 13 major mineral products of this state. The table also indicates the number of different mineral products produced by any county in the state. Production of a commodity is indicated by an X.
